[*Method for accessing data on an optical disc*]

Abstract of Disclosure

A method for accessing an optical disk with an optical disc drive. The optical disc contains at least a session including a lead-in area and a program data area. The method for accessing the optical disk with the optical disc drive includes providing the optical disc drive an optical pickup for accessing the data on the optical disc, using the optical pickup to record a table of contents (TOC) in the lead-in area of the session of the optical disc, using the pick-up head to record descriptive data corresponding to the TOC in the lead-in area of the session, and using the optical pickup to record program data corresponding to the TOC in the program data area of the session.
